TOPIC: A patient who was expected to die but survived

A patient who was expected to die survived after a long and excellent plastic surgery. She sat in her hospital bed looking at her beautiful post operative face from a mirror. She was surprised and could not believe the face she was in the mirror. One could see that she was very happy and appreciative.

Her significant others and her parents were highly appreciative too.

I believe that the survival of this patient came about because of the willingness of the surgical and anesthesia team to apply all efforts for the survival of this patient. I also believe that the anesthesia team was blessed with lot of experiences in theoretical and clinical anesthesia. My mind also tell me that the survival of this patient depended on the clinical judgement and the team willingness to restore the patient hope. The team did their best and left the rest with God who restore her life and give the patient mercy.

It is always helpful to do something in another person's life as a health care provider. The anesthesia and the surgical team hearts allow them to try, to think critically to meet the challenges of preventing death in the patient. Patient X survival also depends on the team's clinical knowledge, and adequate assessment techniques, pre, post and intra operative. It also included the willingness to put in time, and adequate monitoring system. The identification of pre and post operative problem made it most safer. Finally survival of the patient was due to well done plan and intervention.
