

Recovery – After 5 minutes of transfer she became very violent and restless with air under the tissues of the face, neck, chest and swollen tongue. I inserted an Oropharyngeal airway, gave Oxygen 100% via face mask, Inj Hydrocortisone 100mg. Called for help from senior Anaesthetist but before help could arrive the patient died within ten minutes in recovery.

NOTE – The Surgeon said I killed the patient because of the injection Ketamine.

My question is

What killed the patient is it

1. My anaesthetic drugs?
2. The Antibiotics?
3. Why the emphysema? Is it due to my technique?
